

1.11. Let G be the graph of Figure 1.20. Let $x = \{e, f\}$ where $e = ru$ and $f = uw$, and let $U = \{u, w\}$. Draw the subgraphs $G-x$ and $G-U$ of G .

Solution 1.11

1.13

a) Give an example of a connected graph G containing three vertices u, v, w such that $d(u, v) = d(u, w) = d(v, w) = \text{diam}(G) = 3$

$$\begin{aligned}
 d(w, v) &= \{w u_3, u_3 u_2, u_2 v\} \\
 d(w, u) &= \{w u_3, u_3 u_1, u_1 u\} \\
 d(u, v) &= \{u u_1, u_1 u_2, u_2 v\} \\
 \text{diam}(G) &= 3
 \end{aligned}$$

b) Is there some relation between the number of vertices and the diameter of a connected graph?

1.15

Draw all connected graphs of order 5 in which the distance between every two distinct vertices is odd. Explain why you know that you have drawn all such graphs.

Solution

(0) $\text{dist}(u, v) \geq 1$ as G connected.

(1) $\text{dist}(u, v)$ is the length (no of edges) of the geodesic path

(2) for any path W , 2.1 $|W| = |E(W)|$

$$2.2 |E(W)| + 1 = |V(W)|$$

$$2.3 |W| = |V(W)| - 1$$

(3) \forall Path P , $|P| \leq n - 1$, where $n = |V(G)|$

Paths may not have more vertices than the total sum of vertices in a graph

(4) Therefore from 2.3 and 3 we conclude for order 5...

$$\forall u, v \in V(G)$$

$$\cdot \text{dist}(u, v) \geq 1$$

$$\cdot \text{dist}(u, v) \leq |V(G)| - 1 \Rightarrow \text{dist}(u, v) \leq 4$$

$$\cdot \text{dist}(u, v) \text{ is odd}$$

Connected Graph

$$2.3 \neq 3$$

Given

(5) So from 4. we can see

$$\forall u, v \in V(G) \dots$$

$$\text{dist}(u, v) = 1 \quad \vee \quad \text{dist}(u, v) = 3$$

(6) The graph where $\text{dist}(u, v) = 1$ is trivial. Is the complete graph of order 5

(7) There is no graph of order 5 s.t. $\forall u, v \in V(G)$, $\text{dist}(u, v) = 3$

• let a G of order 5 where $\text{dist}(u, v) = 3 \quad \forall u, v$.

• let the path $P = \{u, x, v\}$

• There is a path $u-x$ of length = 1

• Impossible

(8) Is there any that has $\text{dist}(u, v) = 1$ OR $\text{dist}(u, v) = 3$?

• The complete graph of order 5 honors this criterion

• Therefore, we searching for a graph G where

$$\cdot \text{dist}(u, v) = 1 \text{ OR } \text{dist}(u, v) = 3$$

$$\cdot \exists u, v \in V(G) \text{ s.t. } \text{dist}(u, v) = 3$$

at least one

(9) We will show that such a graph does not exist.

Let G with $|G| = 5$ where

$$\cdot \text{dist}(u, v) = 1 \text{ OR } \text{dist}(u, v) = 3 \quad \forall u, v \in V(G)$$

$$\cdot \exists u, v \in V(G) \text{ s.t. } \text{dist}(u, v) = 3$$

let Geodesic path P $u-v$ of size 3

$$P = (v_0 = u, x, y, v) \quad x, y \in V(G)$$

Path P ($v_0 = u, x, y, v$) reveals path $u-y$

Path P has size 2

Impossible

(10) The only graph G of order 5 that honors this criterion is the complete graph of order 5

1.17 : To do same as lecture 15.

1.19 : Theorem 1.10 states that a graph G of order 3 or more is connected if and only if G contains two distinct vertices u, v such that $G-u, G-v$ are connected.

Based on this one, one might suspect that the following statement is true ...

"Every connected graph G of order 4 or more contains three distinct vertices u, v and w such that $G-u, G-v, G-w$ are connected"

Is it true?

Solution

- here is a connected graph G of order 4 or more not having 3 distinct u, v, w s.t. $G-u, G-v, G-w$ connected

$$V(G) = \{a, b, c, d\}$$

$$E(G) = \{(a, b), (b, c), (c, d)\}$$
